I

AB The invention relates to a pharmaceutical composition characterized by containing a compound I (ring A and B are (un)substituted monocycle unsatd. hetero rings, etc.; R = H, lower alkyl, lower alkonoyl, lower alkoxycarbonyl) or its salt or prodrug as an active component, suitable for use for treatment and/or prevention of diabetes or obesity. For example, 2-(4-ethylbenzyl)-N-(β-D-glucopyranosyl)aniline was prepared, and examined for its inhibitory effect on SGLT 2 (sodium-dependent glucose transporter 2) in vitro.

AB N,N'-Di-D-glucopyranosyldiaminodiphenylmethane [i.e., N,N'-[(methylene)di-4,1-phenylene]-D-glucopyranosylamine] was prepared by the condensation reaction of D-glucose with 4,4'-diaminodiphenylmethane (at a molar ratio of 1:1) in anhydrous methanol under reflux for 25 h in a yield of 53.3% and purity of 99.4%. Its structure was characterized by elemental anal., IR, and NMR spectroscopy. The research of the hydrolysis of the product showed the condensation reaction was at equilibrium The influence of time and the 4,4'-diaminodiphenylmethane concentration in water on the hydrolysis was also researched.

AB Aryl-aminodeoxy monosaccharides I, wherein A and B are (1) A is an optionally substituted unsatd. monocyclic heterocyclic , and B is an optionally substituted unsatd. monocyclic heterocyclic , an optionally substituted unsatd. fused hetero-bicyclic , or an optionally substituted benzene , (2) A is an optionally substituted benzene , and B is an optionally substituted unsatd. monocyclic heterocyclic , an optionally substituted unsatd. fused hetero-bicyclic , or an optionally substituted benzene , or (3) A is an optionally substituted unsatd. fused hetero-bicyclic , wherein -NR- group and -CH2- group are both on the same of the unsatd. fused hetero-bicyclic , and B is an optionally substituted monocyclic unsatd. heterocyclic , an optionally substituted unsatd. fused hetero-bicyclic , or an optionally substituted benzene ; and R is a hydrogen atom, a lower alkyl group, a lower alkanoyl group or a lower alkoxycarbonyl group, or a pharmaceutically acceptable salt thereof, or a prodrug thereof. A method is claimed for treatment of type 1 and 2 diabetes mellitus, which comprises administering to a mammalian species in need of treatment a therapeutically effective amount of the compound, or in combination with another antidiabetic agent, an agent for treating diabetic complications, an anti-obesity agent, an antihypertensive agent, an antiplatelet agent, an anti-atherosclerotic agent and/or a hypolipidemic agent. Thus, title II was prepared and tested as an antidiabetic agent. The dosage of the present compd.s or a pharmaceutically acceptable salt thereof may vary according to the administration routes, ages, body weight, conditions of a patient, or kinds and severity of a disease to be treated, and it is usually in the range of about 0.1 to 50 mg/kg/day, preferably in the range of about 0.1 to 30 mg/kg/day.

AB A series of novel guanidinoglycosides was successfully synthesized. This was accomplished with the use of Mitsunobu conditions as a strategy to convert the glycopyranose anomeric hydroxy group to give the corresponding substituted masked guanidines in high yields. Subsequent deprotection and coupling with Fmoc protected β-amino acid, afforded a series of N,N'-substituted-methylisothioureas. Cleavage of Fmoc followed by concomitant cyclization was achieved with a catalytic amount of DBU to give the guanidinoglycosides.

AB The first total synthesis of one of the spicamycin congeners, SPM VIII I, is described. A preliminary model study for construction of the characteristic N-glycoside linkage in spicamycin using tetra-O-benzyl-β-D-mannopyranosylamine and halopurines revealed that Pd-catalyzed conditions. It was also shown that thermal anomerization of the N-glycosides easily occurred, which resulted in the predominant formation of the β-anomer as the thermodynamically favored compound, and the activation energy of anomerization of 15 was estimated to be ca. 30 kcal/mol. The novel aminoheptose unit of spicamycin was prepared stereoselectively by carbon elongation of an acyclic aldehyde, prepared by ring cleavage reaction of a highly functionalized cyclohexane derived from naturally abundant myo-inositol. The Pd-catalyzed coupling reaction of the β-heptopyranosylamine with protected 6-chloropurine, followed by deprotection, provided spicamycin amino nucleoside, whose condensation with dodecanoylglycine completed the total synthesis of I. This study confirmed the proposed unique structure of a novel nucleoside antibiotic.

I

AB 4,4'-Methylenebis(2-chloroaniline) (MBOCA)(I) [101-14-4] metabolism in canine liver and kidney slices was investigated using HPLC to sep. the metabolites. Liver slices metabolized 5-10% of the [14C]MBOCA in 60 min and produced 7 metabolites resolved by HPLC. The major metabolite, representing .apprx.80% of the metabolism, was 2-amino-5-[(4-amino-3-chlorophenyl)methyl]-3-chlorophenyl H sulfate [102411-04-1], previously identified as the major urinary metabolite in dogs. An O-glucuronide [102411-06-3] was characterized as labile to β-glucuronidase, stable to arylsulfatase, and mild acid. It was formed in increased amts. when 2,6-dichloro-4-nitrophenol (DCNP) was added to the incubation. Two other glucuronide metabolites were labile to mild acid and β-glucuronidase, stable to arylsulfatase, and were formed in decreased amts. in the presence of D-(+)-galactosamine (D-gal) and p-nitrophenyl sulfate (PNPS). Renal cortical slices metabolized 3-5% of the [14C]MBOCA in 90 min, producing 6 metabolites. Based on retention time and lability to hydrolysis, 3 of these, the MBOCA-glucoside, a glucuronide, and 2-amino-5-[(4-amino-3-chlorophenyl)methyl]-3-chlorophenyl H sulfate, were also found as kidney metabolites. One addnl. S-containing metabolite was labile to mild acid and arylsulfatase. The major kidney metabolite represented 25-40% of the metabolism and was unaffected by mild acid, β-glucuronidase, arylsulfatase, DCNP, anddD-gal. Covalent binding in liver slices was 20-27 pmol/mg of wet weight/60 min and in kidney was 9-13 pmol/mg of wet weight/90 min. Binding was not altered in either tissue by

D-gal, PNPS, or low concns. of DCNP. Renal medullary slice incubations produced no [14C]MBOCA metabolites observed by HPLC with UV absorbance or radioactivity monitoring. Tissue covalent binding was 1.2 pmol/mg/90 min and was unchanged by the addition of aspirin or indomethacin, but doubled with 1 mM arachidonic acid.
